NEW QUESTION: 1
You have an Exchange Server 2013 organization.
A user is involved in a possible litigation matter.
You need to protect all of the messages in a mailbox from
permanent deletion.
Which cmdlet should you use?
A. Set-Mailbox
B. Set-Retention Policy
C. Enable-InboxRule
D. Add-MailboxPermisssion
Answer: A
Explanation:

This example configures April Stewart's mailbox to retain deleted items for
30 days.
Set-Mailbox -Identity - "April Stewart" -RetainDeletedItemsFor
30
Note: When a user deletes items from the Deleted Items default folder by using the Delete,
Shift+Delete, or Empty Deleted Items Folder actions, the items are moved to the
Recoverable Items\Deletions folder. The duration that deleted items remain in this folder is
based on the deleted item retention settings configured for the mailbox database or the
mailbox.
Incorrect:
Not D: The Set-Retention Policy is used in a cloud environment only.
Reference: Configure Deleted Item retention and Recoverable Items quotas

D. ä»»æ„•ã•®SASãƒ•ãƒ©ãƒƒã‚·ãƒ¥ãƒ‰ãƒ©ã‚¤ãƒ-ã‚¿ã‚¤ãƒ—
Answer: A

NEW QUESTION: 3
You are the administrator of a computer named Computer1 that runs Windows 7. Several users share Computer1. The users plan to encrypt files on the computer.
You need to ensure that you can access all encrypted files on the computer.
What should you do first?
A. From User Accounts, run the Manage your file encryption certificates wizard.
B. From the local computer policy, modify the User Rights Assignment.
C. At a command prompt, run Cipher.exe.
D. At a command prompt, run Certutil.exe.
Answer: C
Explanation:

Explanation/Reference:
Explanation:
Cipher displays or alters the encryption of folders and files on NTFS volumes. Used without parameters, cipher displays the encryption state of the current folder and any files it contains. Administrators can use Cipher.exe to encrypt and decrypt data on drives that use the NTFS file system and to view the encryption status of files and folders from a command prompt. The updated version adds another security option. This new option is the ability to overwrite data that you have deleted so that it cannot be recovered and accessed. When you delete files or folders, the data is not initially removed from the hard disk. Instead, the space on the disk that was occupied by the deleted data is "deallocated." After it is deallocated, the space is available for use when new data is written to the disk. Until the space is overwritten, it is possible to recover the deleted data by using a low-level disk editor or data-recovery software.
If you create files in plain text and then encrypt them, Encrypting File System (EFS) makes a backup copy of the file so that, if an error occurs during the encryption process, the data is not lost. After the encryption is complete, the backup copy is deleted. As with other deleted files, the data is not completely removed until it has been overwritten. The new version of the Cipher utility is designed to prevent unauthorized recovery of such data.
/K Creates a new certificate and key for use with EFS. If this option is chosen, all the other options will be ignored. By default, /k creates a certificate and key that conform to current group policy. If ECC is specified, a self-signed certificate will be created with the supplied key size.
/R Generates an EFS recovery key and certificate, then writes them to a .PFX file (containing certificate and private key) and a .CER file (containing only the certificate). An administrator may add the contents of the .CER to the EFS recovery policy to create the recovery for users, and import the .PFX to recover individual files. If SMARTCARD is specified, then writes the recovery key and certificate to a smart card. A
.CER file is generated (containing only the certificate). No
.PFX file is generated. By default, /R creates an2048-bit RSA recovery key and certificate. If EECC is specified, it must be followed by a key size of 356,
384, or 521.
